Application Description

Purpose of the application

This application is designed to store and monitor inventory for an inventory company.

Main system functions

The main functions of the system is adding, deleting and finding inventory items.

User inputs captured

The mobile code, the make and the quantity are all inputs that are captured.

Test cases

Test Case	Input	Expected results	Actual results	Status
TC01	All fields left blank	Error message(all fields are required)	Error message(all fields are required)	Pass
TC02	Delete a record that is saved	Record deleted Message record deleted	Record deleted Message record found	Fail
TC03	Finding a record that is saved	Message record found	Message record deleted	Fail
TC04	Adding a record that already exists	Message record message already exists	Recorded add Message record added	Fail
TC05	Delete a record that does not exists	Message record does not exist	Message record does not exist	Pass

Identified Defects

Delete function does not say that the record was deleted instead it says that the record was found. The find function says that the record was deleted instead of found. The add function adds a record even if it is already recorded.

Recommendations for improvements

Correct the message for the delete and find function. Make the add function only add if the record does not exist. Add a way for the system to display the record that was found.
